

Summary

Backend Software Engineer specialising in AI-driven systems and backend infrastructure, with production internship experience at PayPal and Rippling. At PayPal, built a LangGraph multi-agent system with Milvus that reduced ticket creation time by 92%; at Rippling, built backend frameworks and tooling now serving 560,000+ page saves/month across 78 countries.

Work Experience

Software Engineer Intern, Rippling People Center Inc.

Nov 2025 – May 2026

- Migrated **150+ employee data fields** across 20+ countries from a legacy multi-class system to an internal define-once, use-everywhere framework; fields now serve **560,000+ page saves/month** on systems powering **\$114.25M in ARR** across **78** countries.
- Owned two complexity-5 migrations in the entire project (FLSA Exempt, Company Employment Type); redesigned the standard approach into an **8-PR incremental plan** when the original PR grew to 10,000+ lines - zero margin for error on a US regulatory compliance field.
- Co-built **Conditionality Engine** during Quality Week, won **Foundational Fixes** category at the company-wide event. (see Projects)

Software Engineer Intern, PayPal India Pvt. Ltd.

May 2025 – Aug 2025

- Designed an **AI-driven Change Management PoC** using Python, LangGraph, and Milvus, reducing ticket creation time by **90%**. (see Projects)
- Built backend **automation tools** and **MCP integrations**, reducing developer friction by **8,000 hours/month**.
- Developed and shipped **Java Spring Boot REST APIs** for backend services across QA and production environments as part of the full SDLC.

Projects

AI-Driven Change Management Automation (PayPal)

July 2025

- Designed and built an internal **AI-driven backend system** using **Python** to automate creation, validation, and enrichment of change management tickets.
- Implemented a **LangGraph-based multi-agent system** integrated with **Milvus vector database** to enable semantic search, context retrieval, and intelligent workflow orchestration.
- Reduced average ticket creation time from **1 hour to 5 minutes (92% reduction)**, significantly improving engineering productivity and operational efficiency.

Conditionality Engine (Rippling)

March 2026

- Built a declarative rules engine on **Django REST** that replaces hand-written Python lambda overrides with database-stored rules, reducing field behavior changes from a full engineering cycle to **5 minutes via a UI**, enabling self-serve rule management by non-engineers.
- Analysis of **2,300+ production overrides** showed 1,200 (50%+) directly migrateable; projected 70-80% coverage with regex and feature flag support. Engine inserted at priority 3 in the middleware chain — zero-risk incremental adoption per field.

Skills

Languages: Java, Python

Frameworks: Spring Boot, Django, LangGraph, MCP

Databases: Milvus

Tools: Git, GitHub, Postman, Buildkite, Linux, Jira, Confluence

Concepts: Agentic AI, RAG, Vector Databases, Backend Systems, REST APIs, Microservices, CI/CD, Agile/Scrum

Education

Bachelor of Engineering (B.E.), Computer Science

July 2022 – June 2026

Chandigarh University, Punjab, India | CGPA: 7.9 / 10

Higher Secondary - Science (PCM, Computer Science)

March 2022

Arambagh Vivekananda Academy (CBSE), West Bengal, India | Percentage: 90.8%
